

METHOD AND DEVICE FOR ENABLING AND DISABLING GROUP TRANSMISSIONS

5

Abstract of the Disclosure

A source device (110) receives a carrier signal and continuously monitors the carrier signal for a first predetermined condition and a second predetermined condition. The source device (110) transmits data if the first predetermined condition is satisfied. The source device (110) ceases transmission of data if the first predetermined condition subsequently is not satisfied or if a second predetermined condition is satisfied.
